NVR Homework: Summer Week 11

In these questions you are shown some figures on the left. Each figure has a code that goes with it. You must decide how the code is related to the figure. Then find the correct code for the **new figure** on the right and mark your answer on the answer sheet.

The example below has been done for you.

Example

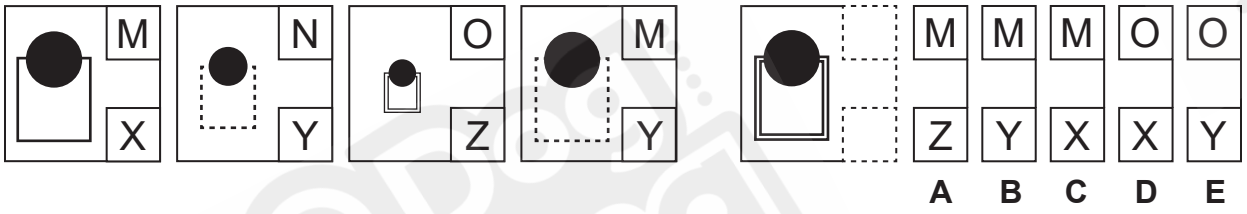

Answer: B

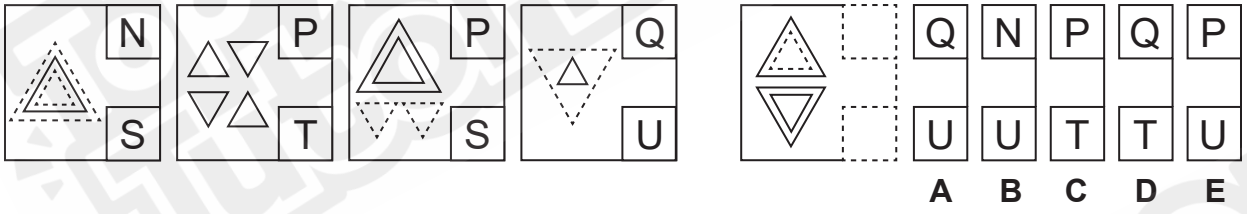

In the example above, the top and bottom letters should be studied separately. The top letters represent a feature within the figures and the bottom letters represent a different feature. Two of the four figures use the letter F at the top. This means they share a feature of which the other two do not. It cannot be the shading of the top shape as all four figures are shaded white. The only other similarity is that their lower shapes are rotated by 180° in comparison to the top shape. Therefore, G must represent no rotation and H must represent a 90° turn. The bottom letters represent the shading of the bottom shape as both figures with the code A have striped shading, which is different from the other two. Therefore the unknow code must be H for 90° rotation and C for dark shading.

Now complete the practice questions below.
